Control Statements

- Decision or Selection
 - if-else
 - switch-case
- Iteration (loop)
 - for
 - while
 - do-while
- Jump
 - break
 - continue
 - goto
 - return

if-else statement

```
if (condition) {
        statement 1;
        statement 2;
if (condition) {
        statement 1;
        statement 2;
else {
        statement 3;
        statement 4;
```

```
if (condition)
    statement 1;

if (condition)
    statement 1;
else
    statement 2;
```

- Condition is any expression using relational, logical or other operators.
 - 0 false condition
 - 1 true condition

Ternary/conditional operator

 if-else can be nested within each other.

condition? expression1 : expression2

- If condition is true, expression1 is executed; otherwise expression2 is executed.
- Ternary operators can also be nested.
- expression1 & expression2 must be expressions (not statement).
 - expression evaluate to some value.
 - statement C statement ends with ;

switch-case

```
switch (expression) {
   case const-expr1:
       statement(s);
       break;
  case const-expr2:
       statement(s);
       break;
  default:
       statement(s);
       break;
```

- Switch-case is used to select one of the several paths to execute depending on value of int expression.
- case constants cannot be duplicated.
- break statement skips remaining statements and continues execution at the end of switch closing brace.
- If break is missing, statements under sub-sequent case continue to execute.
- default case is optional and it is executed only if an expression is not matching with any of the case constant.
- Sequence of cases and default case doesn't matter.

Loops

- Control statements used for repeating a set of instructions number of times is called as "LOOP".
- Every loop has
 - Initialization statement
 - Terminating condition
 - Modification statement(Increment/Decrement)
 - Body of loop
- The variable that is used for terminating condition is referred as 'loop variable'.

while loop

• Used to repeat a statement (or block) while an expression is true (not zero).

• Syntax:

```
initialization;
while(condition) {
    statement1;
    statement2;
    modification;
}
```

for loop

- Used to repeat a statement (or block) while an expression is true (not zero).
- Syntax:

```
for(initialization; condition; modification) {
    statement1;
    statement2;
}
```

Thank you!
